

If windows can't recognize java commands such as java, javac, and rmiregistry, do the following steps:

1. Go to **C** drive where your **jdk** folder is located, click on **bin** folder and copy the address. In my PC, the address looks like this:
C:\Program Files\Java\jdk1.8.0_231\bin
2. Go to Control Panel\System and Security\System
3. Select Advanced System parameters.
4. Click on Variable Environment.
5. Go to System Variable, select Path and click Edit then New.
6. Paste the address you copied before then click Ok.
7. Go now to the User Variable and click New.
8. Write in the Variable Name field the word Path.
9. Paste again the address you copied before in the Variable Value field.
10. Press Ok buttons and close the windows.
